

# Web API Design with Spring Boot Week 15 Coding Assignment

**Points possible: 75**

**URL to GitHub Repository:** <https://github.com/comradArman/JeepSales>

**URL to Public Link of your Video:** <https://youtu.be/zEltpHoX2Fk>

---

## Instructions :

1. Follow the **Coding Steps** below to complete this assignment.

- In Spring Tool Suite (STS), or an IDE of your choice, write the code that accomplishes the objectives listed below. Ensure that the code compiles and runs as directed.
- Use your existing repo or create a new repository on GitHub for this week's assignment and push your completed code to the repo, including your entire Maven Project Directory (e.g., jeep-sales) and any additional files (e.g. .sql files) that you create. In addition, screenshot your ERD and push the screenshot to your GitHub repo.
- Include the screenshots into this Assignment Document indicated by: 
- Create a video showcasing your work:
  - In this video: record and present your project verbally while showing the results of the working project.
  - Easy way to Create a video: Start a meeting in Zoom, share your screen, open Eclipse with the code and your Console window, start recording & record yourself describing and running the program showing the results.
  - Your video should be a maximum of 5 minutes.
  - Upload your video with a public link.
  - Easy way to Create a Public Video Link: Upload your video recording to YouTube with a public link.

2. In addition, please include the following in your Coding Assignment Document:

- The requested screenshots, indicated by: 
- The URL for this week's GitHub repository.
- The URL of the public link of your video.

3. Save the Coding Assignment Document as a .pdf and do the following:

- Push the .pdf to the GitHub repo for this week.
  - Upload the .pdf to the LMS in your Coding Assignment Submission.
-

# Web API Design with Spring Boot Week 15 Coding Assignment

**Here's a friendly tip:** as you watch the videos, code along with the videos. This will help you with the homework. When a screenshot is required, look for the icon:  You will keep adding to this project throughout this part of the course. When it comes time for the final project, use this project as a starter.

## Project Resources:

<https://github.com/promineotech/Spring-Boot-Course-Student-Resources>

## Coding Steps:

- 1) In the application you've been building add a DAO layer:
  - a) Add the package, `com.promineotech.jeepp.dao`.
  - b) In the new package, create an interface named `JeepSalesDao`.
  - c) In the same package, create a class named `DefaultJeepSalesDao` that implements `JeepSalesDao`.
  - d) Add a method in the DAO interface and implementation that returns a list of Jeep models (class `Jeep`) and takes the model and trim parameters. Here is the method signature:

```
List<Jeep> fetchJeeps(JeepModel model, String trim);
```
- 2) In the Jeep sales service implementation class, inject the DAO interface as an instance variable. The instance variable should be `private` and should be named `jeepSalesDao`. Call the DAO method from the service method and store the returned value in a local variable named `jeeps`. Return the value in the `jeeps` variable (we will add to this later).

# Web API Design with Spring Boot Week 15 Coding Assignment

3) In the DAO implementation class (DefaultJeepSalesDao):

- Add the class-level annotation: `@Service`.
- Add a log statement in `DefaultJeepSalesDao.fetchJeeps()` that logs the model and trim level. Run the integration test. Produce a screenshot showing the DAO implementation class and the log line in the IDE's console. 

- In `DefaultJeepSalesDao`, inject an instance variable of type `NamedParameterJdbcTemplate`.
- Write SQL to return a list of Jeep models based on the parameters: model and trim. Be sure to utilize the SQL Injection prevention mechanism of the `NamedParameterJdbcTemplate` using `:model_id` and `:trim_level` in the query.
- Add the parameters to a parameter map as shown in the video. Don't forget to convert the `JeepModel` enum value to a String (i.e., `params.put("model_id", model.toString());`)
- Call the query method on the `NamedParameterJdbcTemplate` instance variable to return a list of Jeep model objects. Use a `RowMapper` to map each row of the result set. Remember to convert `modelId` to a `JeepModel`. See the video for details. Produce a screenshot to show the complete method in the implementation class. 

# Web API Design with Spring Boot Week 15 Coding Assignment

```
@Override
public Jeep mapRow(ResultSet rs, int rowNum) throws SQLException {
    /// @formatter:off

    return Jeep.builder()
        .basePrice(new BigDecimal(rs.getString("base_price")))
        .modelId(JeepModel.valueOf(rs.getString("model_id")))
        .modelPK(rs.getLong("model_pk"))
        .numDoors(rs.getInt("num_doors"))
        .trimLevel(rs.getString("trim_level"))
        .wheelSize(rs.getInt("wheel_size"))
        .build();

    // @formatter:on
}

}});

}
```

4) Add a getter in the Jeep class for modelPK. Add the @JsonIgnore annotation to the getter to exclude the modelPK value from the returned object.

5) Run the test to produce a green status bar. Produce a screenshot showing the test and the green status bar.
